

LETTER OF RECOMMENDATION

It is with great pleasure that I write this letter in strong support of Kanishk Pachory's application to your esteemed MSc program. I have known Kanishk for over three years, during which I had the opportunity to teach him key core courses Computer Communications (4th Semester) and Computer Networks (5th Semester) and to supervise his academic project work during his final year.

Kanishk's academic journey has consistently reflected a strong foundation in both theoretical and applied aspects of computer science. In my courses, he demonstrated deep curiosity and conceptual clarity in understanding the OSI model, congestion control mechanisms, and advanced network protocols. His inquisitiveness stood out, especially during collaborative class discussions on protocol efficiency and fault tolerance.

Kanishk's final-year Capstone Project, titled "Optimized Task Scheduling In Cloud Using An Enhanced Golden Jackal Optimization Algorithm," was conducted under my supervision. In this research-based endeavor, he developed a sophisticated scheduling engine to assign tasks among heterogeneous agents using adaptive load balancing and dynamic priority queues. The core logic was built using JavaScript and simulated through custom test environments. His work showed a mature grasp of algorithm design and systems thinking, and the project is currently under review for publication in a reputed peer-reviewed international conference proceeding, reflecting his potential for impactful research and academic contribution.

What I find truly impressive about Kanishk is his integration of AI, software engineering principles, and system-level thinking. He seamlessly applied networking fundamentals from my classes to practical challenges in his projects—such as minimizing communication overhead among agents in distributed systems. His work ethic and attention to architectural scalability are exemplary.

In addition to his technical capabilities, Kanishk demonstrates an excellent balance of autonomy and collaboration. He independently drove all phases of his research project from problem identification and algorithm design to testing, documentation, and successful journal submission. Yet he was equally effective in team-based settings, often mentoring peers and coordinating weekly updates with faculty.

His trajectory from corporate experience to teaching to becoming a full-stack developer and AI enthusiast—reflects his unique combination of persistence and passion for innovation. His published GitHub repositories, notably the Gems Stock Management System and HTML Project Gold, display production-grade quality, clean UI/UX, and architectural precision.

I am confident that Kanishk's exceptional motivation, proven research aptitude, and real-world application skills will make him a valuable asset to your program. He has the intellectual depth and creative vision to contribute meaningfully to areas such as distributed computing, intelligent systems, and network-centric AI architectures.

I strongly recommend him without reservation and would be happy to provide further insights into his abilities.

Sincerely,

Dr. Hariharan
